EE4500

Module 5: Networking and Content Delivery

AWS Academy Cloud Foundations

Module overview

Topics

- Networking basics

- Amazon VPC

- VPC networking

- VPC security

- Amazon Route 53

- Amazon CloudFront

Activities

- Label a network diagram

- Design a basic VPC architecture

Demo

- VPC demonstration

Lab

- Build your VPC and launch a web server

Knowledge check

Module objectives

After completing this module, you should be able to:

- Recognize the basics of networking

- Describe virtual networking in the cloud with Amazon VPC

- Label a network diagram

- Design a basic VPC architecture

- Indicate the steps to build a VPC

- Identify security groups

- Create your own VPC and add additional components to it to produce a customized network

- Identify the fundamentals of Amazon Route 53

- Recognize the benefits of Amazon CloudFront

Section 1: Networking basics

Module 5: Networking and Content Delivery

Networks

Subnet 1

Router

Subnet 2

IP addresses

192 . 0 . 2 . 0

11000000   00000000   00000010   00000000
IPv4 and IPv6 addresses

IPv4 (32-bit) address: 192.0.2.0

IPv6 (128-bit) address: 2600:1f18:22ba:8c00:ba86:a05e:a5ba:00FF

Classless Inter-Domain Routing (CIDR)

Network identifier (routing prefix)   Host identifier

| 192 | . | 0 | . | 2 | . | 0 | / | 24 |

Tells you how many bits are fixed

11000000   00000000   00000010   00000000
to 11111111

Fixed   Fixed   Fixed   Flexible

Open Systems Interconnection (OSI) model

Layer	Number	Function	Protocol/Address
Application	7	Means for an application to access a computer network	HTTP(S), FTP, DHCP, LDAP
Presentation	6	• Ensures that the application layer can read the data • Encryption	ASCI, ICA
Session	5	Enables orderly exchange of data	NetBIOS, RPC
Transport	4	Provides protocols to support host-to-host communication	TCP, UDP
Network	3	Routing and packet forwarding (routers)	IP
Data link	2	Transfer data in the same LAN network (hubs and switches)	MAC
Physical	1	Transmission and reception of raw bitstreams over a physical medium	Signals (1s and 0s)

aws

Section 2: Amazon VPC

Module 5: Networking and Content Delivery

Amazon VPC

Amazon VPC

- Enables you to provision a logically isolated section of the AWS Cloud where you can launch AWS resources in a virtual network that you define

- Gives you control over your virtual networking resources, including:
  - Selection of IP address range
  - Creation of subnets
  - Configuration of route tables and network gateways

- Enables you to customize the network configuration for your VPC

- Enables you to use multiple layers of security

aws

VPCs and subnets

- VPCs:
  - Logically isolated from other VPCs
  - Dedicated to your AWS account
  - Belong to a single AWS Region and can span multiple Availability Zones
- Subnets:
  - Range of IP addresses that divide a VPC
  - Belong to a single Availability Zone
  - Classified as public or private

AWS Cloud
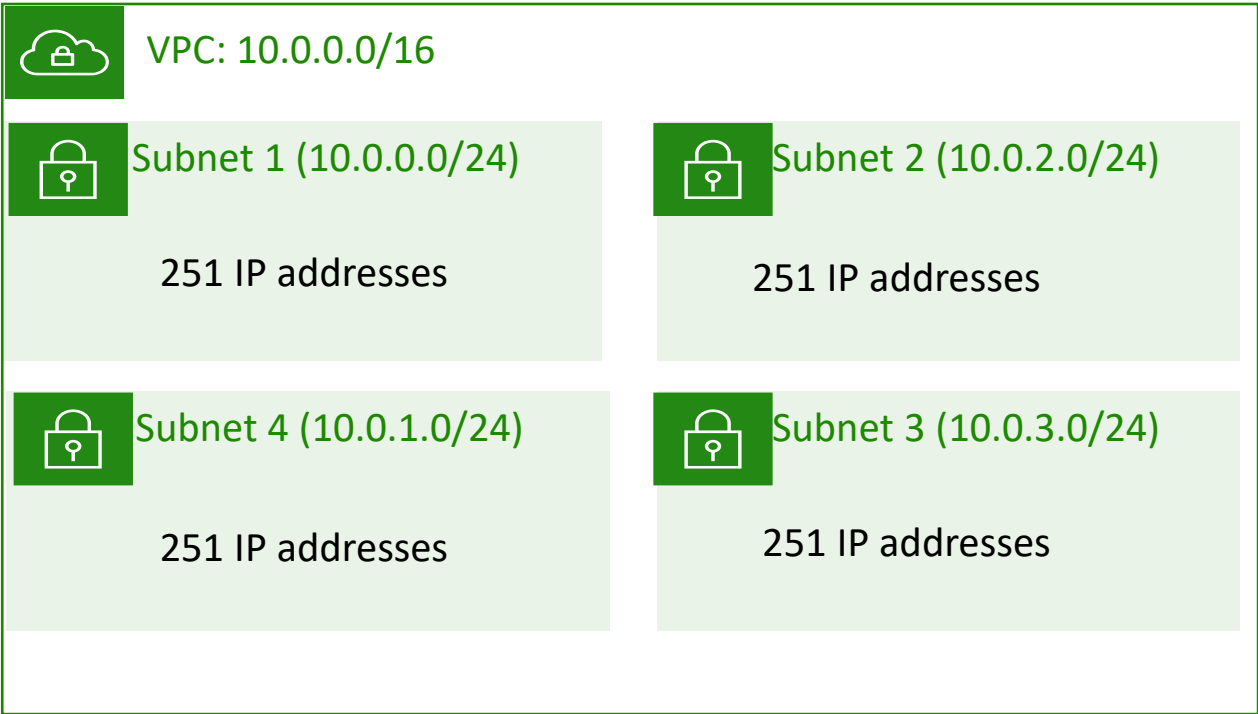

Region

Availability Zone 1

Availability Zone 2

VPC

Subnet

Subnet
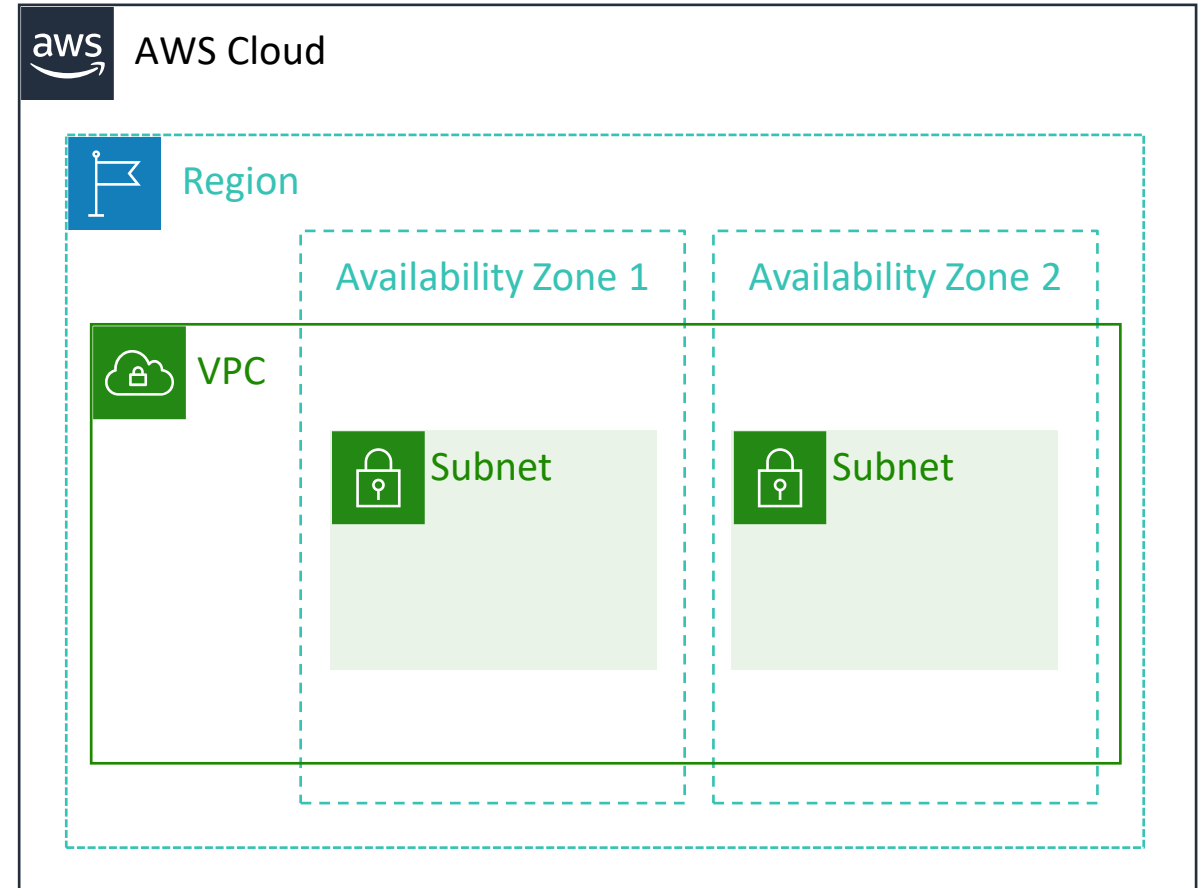

IP addressing

- When you create a VPC, you assign it to an IPv4 CIDR block (range of private IPv4 addresses).

- You cannot change the address range after you create the VPC.

- The largest IPv4 CIDR block size is /16.

- The smallest IPv4 CIDR block size is /28.

- IPv6 is also supported (with a different block size limit).

- CIDR blocks of subnets cannot overlap.

VPC

x.x.x.x/16 or 65,536 addresses (max)
to
x.x.x.x/28 or 16 addresses (min)

Reserved IP addresses

Example: A VPC with an IPv4 CIDR block of 10.0.0.0/16 has 65,536 total IP addresses. The VPC has four equal-sized subnets. Only 251 IP addresses are available for use by each subnet.

VPC: 10.0.0.0/16

Subnet 1 (10.0.0.0/24)

251 IP addresses

Subnet 2 (10.0.2.0/24)

251 IP addresses

Subnet 4 (10.0.1.0/24)

251 IP addresses

Subnet 3 (10.0.3.0/24)

251 IP addresses

| IP Addresses for CIDR block 10.0.0.0/24	Reserved for
10.0.0.0	Network address
10.0.0.1	Internal communication
10.0.0.2	Domain Name System (DNS) resolution
10.0.0.3	Future use
10.0.0.255	Network broadcast address

aws

Public IP address types

Public IPv4 address

- Manually assigned through an Elastic IP address

- Automatically assigned through the auto-assign public IP address settings at the subnet level

Elastic IP address

- Associated with an AWS account

- Can be allocated and remapped anytime

- Additional costs might apply

Elastic network interface

- An elastic network interface is a virtual network interface that you can:

  - Attach to an instance.

  - Detach from the instance, and attach to another instance to redirect network traffic.

- Its attributes follow when it is reattached to a new instance.

- Each instance in your VPC has a default network interface that is assigned a private IPv4 address from the IPv4 address range of your VPC.

Subnet: 10.0.1.0/24

Elastic network interface
Route tables and routes

- A route table contains a set of rules (or routes) that you can configure to direct network traffic from your subnet.

- Each route specifies a destination and a target.

- By default, every route table contains a local route for communication within the VPC.

- Each subnet must be associated with a route table (at most one).

Main (Default) Route Table

Destination	Target
10.0.0.0/16	local

VPC CIDR block

aws

Section 2 key takeaways

- A VPC is a logically isolated section of the AWS Cloud.

- A VPC belongs to one Region and requires a CIDR block.

- A VPC is subdivided into subnets.

- A subnet belongs to one Availability Zone and requires a CIDR block.

- Route tables control traffic for a subnet.

- Route tables have a built-in local route.

- You add additional routes to the table.

- The local route cannot be deleted.

Section 3: VPC networking

Module 5: Networking and Content Delivery

aws

Lab 2:
Build Your VPC and Launch a Web Server

# Lab 2: Scenario

In this lab, you use Amazon VPC to create your own VPC and add some components to produce a customized network. You create a security group for your VPC. You also create an EC2 instance and configure it to run a web server and to use the security group. You then launch the EC2 instance into the VPC.

Amazon
VPC

Amazon
EC2

Lab 2: Tasks

- Create a VPC.

- Create additional subnets.

Security group

- Create a VPC security group.

- Launch a web server instance.

Lab 2: Final product

AWS Cloud

Region

VPC: 10.0.0.0/16

Availability Zone A

Public subnet 1: 10.0.0.0/24

Lab debrief:
Key takeaways

Section 5: Amazon Route 53

Module 5: Networking and Content Delivery
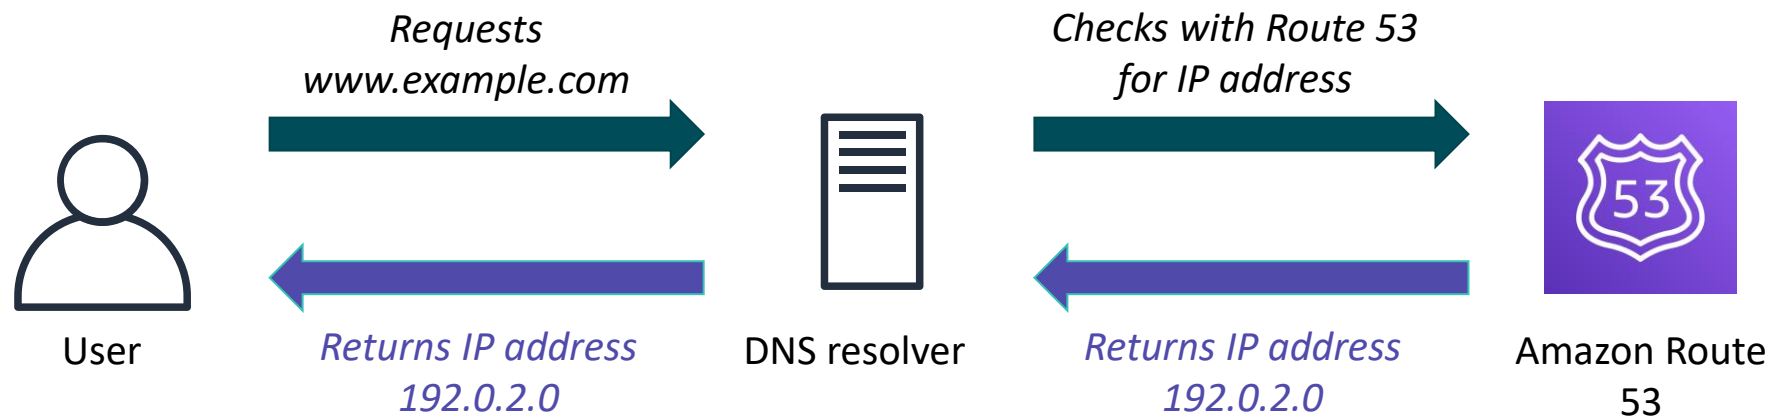

aws

Amazon Route 53

Amazon Route 53

- Is a highly available and scalable Domain Name System (DNS) web service

- Is used to route end users to internet applications by translating names (like www.example.com) into numeric IP addresses (like *192.0.2.1*) that computers use to connect to each other

- Is fully compliant with IPv4 and IPv6

- Connects user requests to infrastructure running in AWS and also outside of AWS

- Is used to check the health of your resources

- Features traffic flow

- Enables you to register domain names

Amazon Route 53 DNS resolution

User

Requests
www.example.com

Returns IP address
192.0.2.0

DNS resolver

Checks with Route 53
for IP address

Returns IP address
192.0.2.0

Amazon Route
53

Amazon Route 53 supported routing

- Simple routing – Use in single-server environments

- Weighted round robin routing – Assign weights to resource record sets to specify the frequency

- Latency routing – Help improve your global applications

- Geolocation routing – Route traffic based on location of your users

- Geoproximity routing – Route traffic based on location of your resources

- Failover routing – Fail over to a backup site if your primary site becomes unreachable

- Multivalue answer routing – Respond to DNS queries with up to eight healthy records selected at random
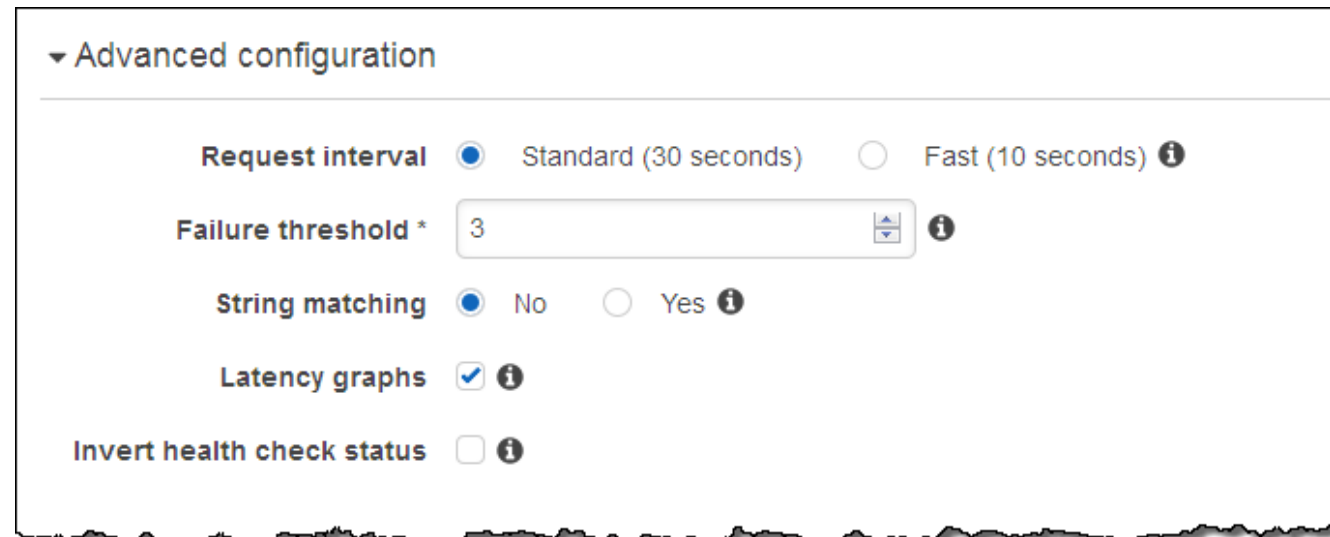

Use case: Multi-region deployment

Amazon Route 53

some-elb-name.us-west-2.elb.amazonaws.com

User

some-elb-name.ap-southeast-2.elb.amazonaws.com

Name	Type	Value
example.com	ALIAS	some-elb-name.us-west-2.elb.amazonaws.com
example.com	ALIAS	some-elb-name.ap-southeast-2.elb.amazonaws.com

Amazon Route 53 DNS failover

Improve the availability of your applications that run on AWS by:

- Configuring backup and failover scenarios for your own applications

- Enabling highly available multi-region architectures on AWS

- Creating health checks

# DNS failover for a multi-tiered web application

Amazon Relational
Database Service
(Amazon RDS)
instance
Section 5 key takeaways

- Amazon Route 53 is a highly available and scalable cloud DNS web service that translates domain names into numeric IP addresses.

- Amazon Route 53 supports several types of routing policies.

- Multi-Region deployment improves your application's performance for a global audience.

- You can use Amazon Route 53 failover to improve the availability of your applications.

Section 6: Amazon CloudFront

Module 5: Networking and Content Delivery

aws

Content delivery and network latency

User
Client
Router
Router
Router
Router
Origin server
Hop
Content delivery network (CDN)

- Is a globally distributed system of caching servers

- Caches copies of commonly requested files (static content)

- Delivers a local copy of the requested content from a nearby cache edge or Point of Presence

- Accelerates delivery of dynamic content

- Improves application performance and scaling

Amazon CloudFront

Amazon CloudFront

- Fast, global, and secure CDN service
- Global network of edge locations and Regional edge caches
- Self-service model
- Pay-as-you-go pricing

Amazon CloudFront infrastructure

- Edge locations
- Multiple edge locations
- Regional edge caches

- **Edge locations –** Network of data centers that CloudFront uses to serve popular content quickly to customers.

- **Regional edge cache –** CloudFront location that caches content that is not popular enough to stay at an edge loca It is located between the origin server the global edge location.
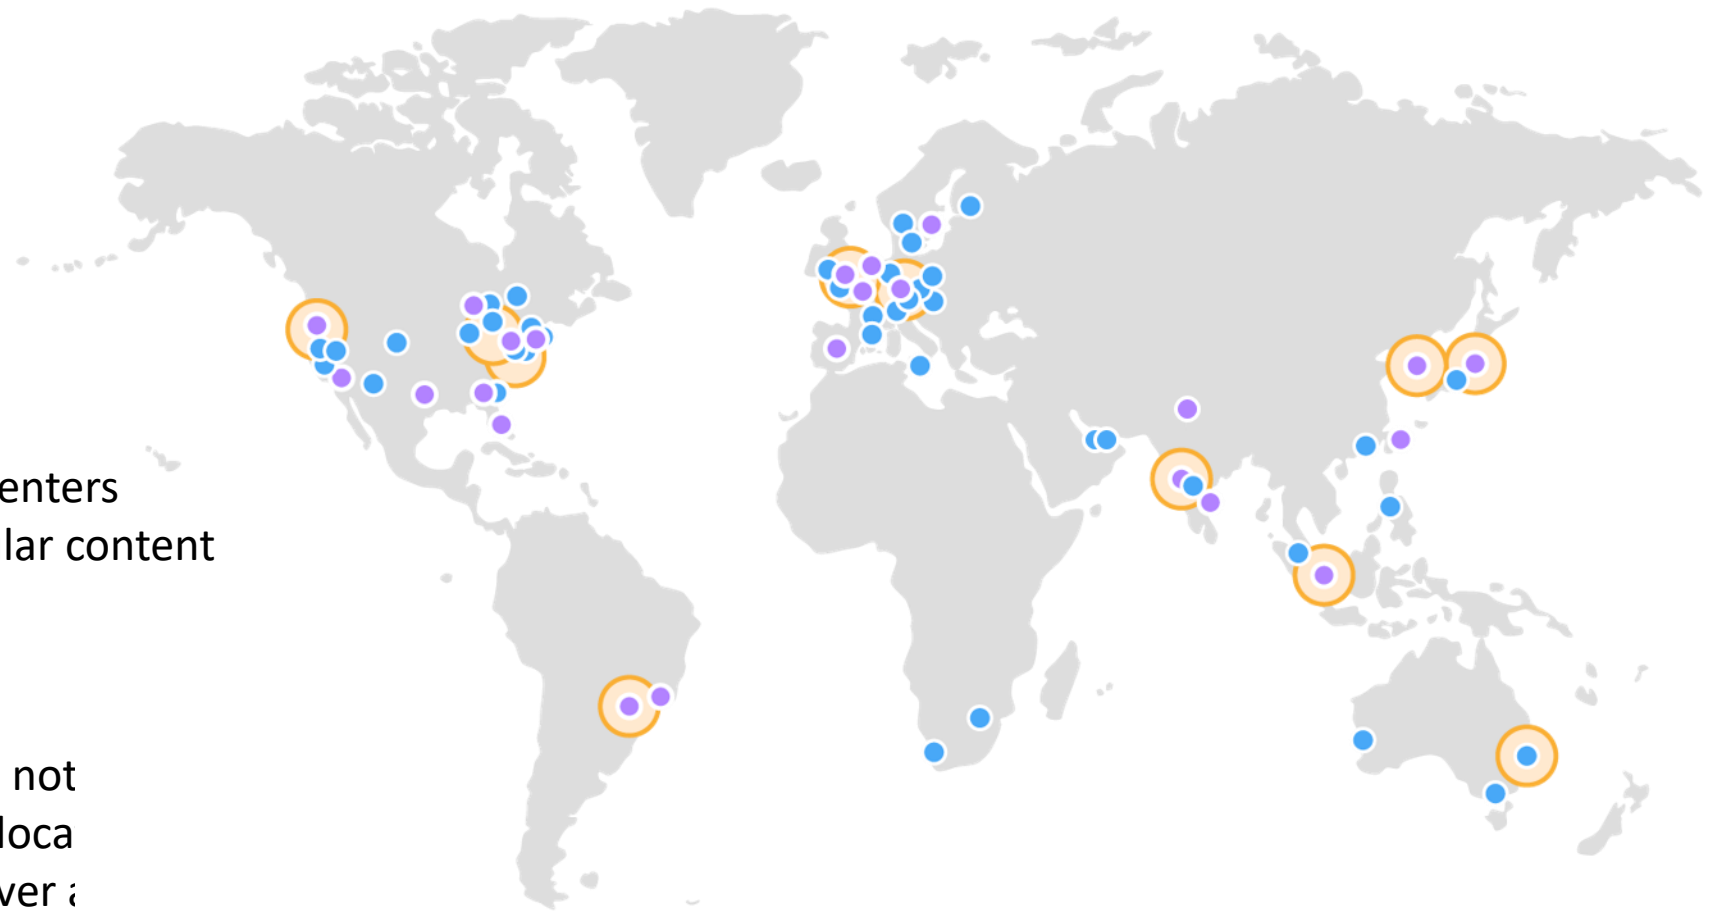

Amazon CloudFront benefits

- Fast and global

- Security at the edge

- Highly programmable

- Deeply integrated with AWS

- Cost-effective

Amazon CloudFront pricing

Data transfer out

- Charged for the volume of data transferred out from Amazon CloudFront edge location to the internet or to your origin.

HTTP(S) requests

- Charged for number of HTTP(S) requests.

Invalidation requests

- No additional charge for the first 1,000 paths that are requested for invalidation each month. Thereafter, $0.005 per path that is requested for invalidation.

Dedicated IP custom SSL

- $600 per month for each custom SSL certificate that is associated with one or more CloudFront distributions that use the Dedicated IP version of custom SSL certificate support.

Section 6 key takeaways

- A CDN is a globally distributed system of caching servers that accelerates delivery of content.

- Amazon CloudFront is a fast CDN service that securely delivers data, videos, applications, and APIs over a global infrastructure with low latency and high transfer speeds.

- Amazon CloudFront offers many benefits.

Module wrap-up

Module 5: Networking and Content Delivery

Module summary

In summary, in this module you learned how to:

- Recognize the basics of networking

- Describe virtual networking in the cloud with Amazon VPC

- Label a network diagram

- Design a basic VPC architecture

- Indicate the steps to build a VPC

- Identify security groups

- Create your own VPC and added additional components to it to produce a customized network

- Identify the fundamentals of Amazon Route 53

- Recognize the benefits of Amazon CloudFront

Complete the knowledge check

Sample exam question

Which AWS networking service enables a company to create a virtual network within AWS?

Choice	Response
A	AWS Config
B	Amazon Route 53
C	AWS Direct Connect
D	Amazon VPC

Sample exam question answer

Which AWS networking service enables a company to create a virtual network within AWS?

The correct answer is D.

The keywords in the question are "AWS networking service" and "create a virtual network".
